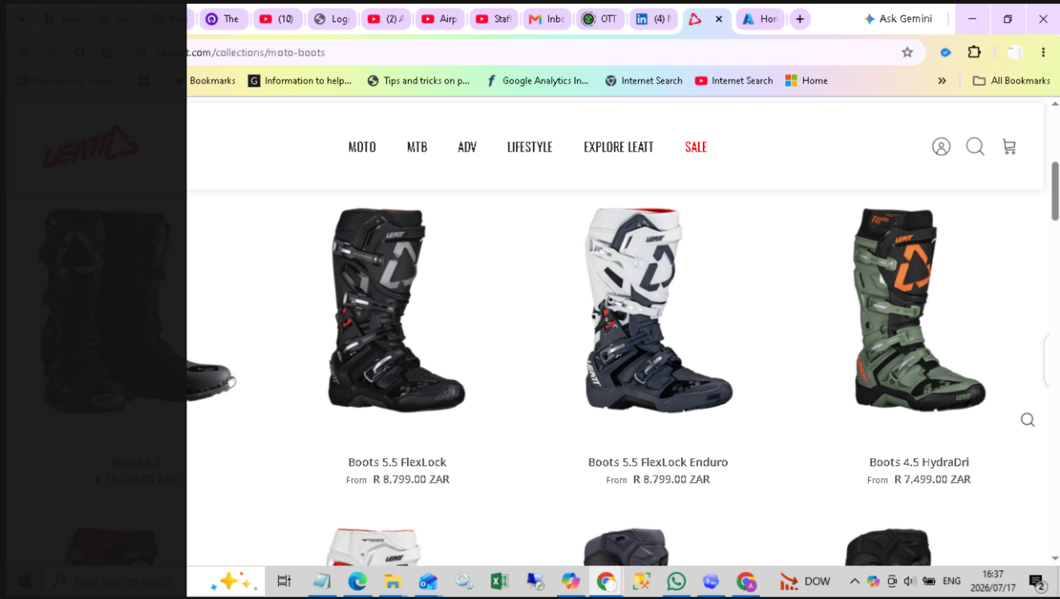
LEATT GROWTH OS

A non-boring ecommerce BI + ML case study

From storefront evidence to Fabric Lakehouse, Power BI, ML return-risk, AI SEO, SAP reconciliation and executive action.



2,000,000 modeled transaction lines | R3.99bn revenue | 4.9% return leakage

One Story, Not A Folder Of Reports

The project reads as a single operating system for ecommerce growth.

The through-line

Leatt sells performance gear. The BI story is therefore about protecting profitable demand: the right product, in the right channel, with the right content, while controlling fit/return risk and proving the numbers back to finance.

1

Storefront Signal

What products, categories and content are visible?

2

Data Engine

Fabric, Lakehouse, Factory, ERD and semantic model.

3

Money Map

Revenue, margin, returns, regions and channels.

4

Growth Loop

SEO, A/B tests, campaigns and competitor signals.

5

Control Tower

ML risk, governance, reconciliation and SAP fit.

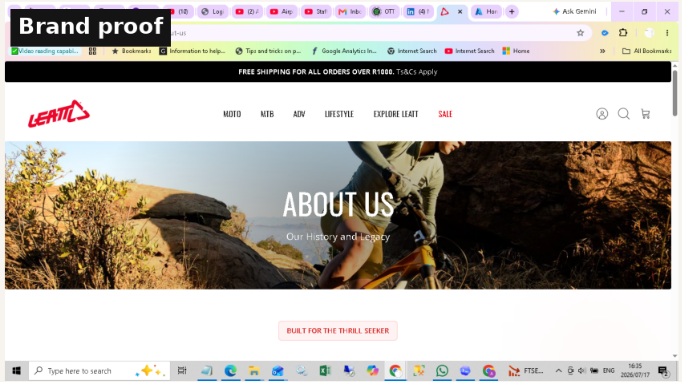
6

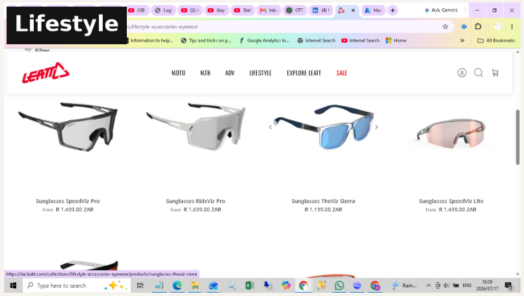
Actions

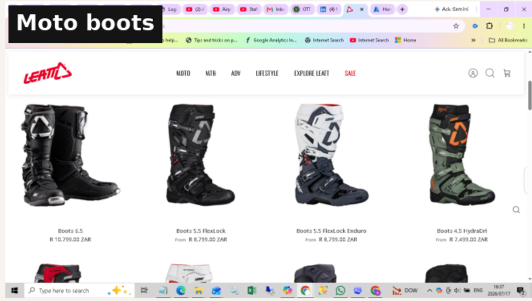
Owner-led 90-day moves and interview-ready proof.

The Storefront Is The Brief

Use the real site as the narrative anchor: product, category, price, content and customer intent.







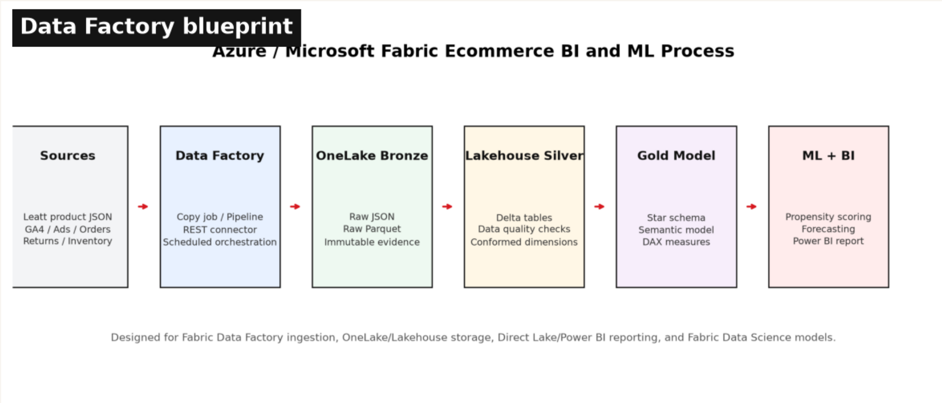
What this signals

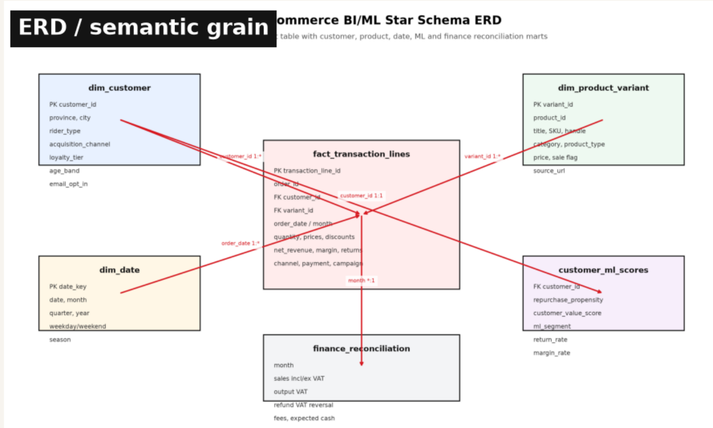
- This is not abstract ecommerce: the category mix has safety, fit, seasonality and premium-price dynamics.
- Public storefront evidence points to Shopify, so SAP Commerce/Hybris is not required for this proof.
- SAP Business One or SAP BW fits as the finance/inventory authority for reconciliation, VAT, stock and margin.
- BI value comes from connecting storefront demand to returns, channel spend, stock risk and finance truth.

The Engine: Fabric, Factory, Lakehouse, Warehouse

LEATT GROWTH OS

This is the proof layer: data movement, modeling, governance and source control.





ROWS

2,000,000

enterprise-scale synthetic transaction fact

WAREHOUSE

SQLite + Fabric plan

local proof plus OneLake runbook

POWER BI

semantic model

report item created through API

GIT

pushed proof

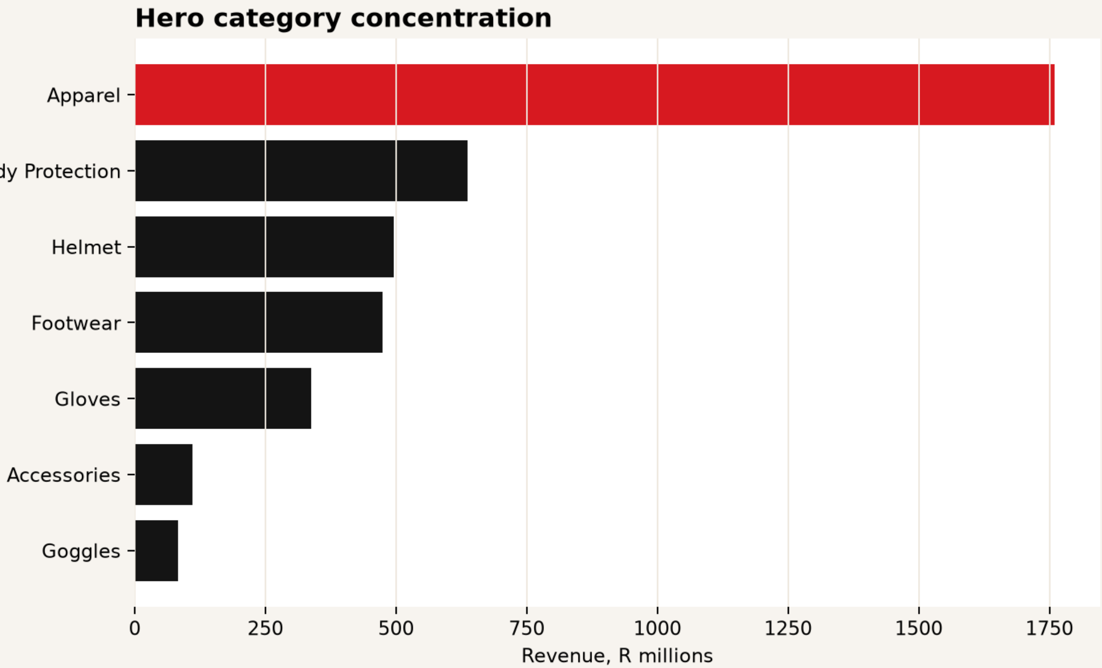
scripts, docs, evidence and outputs

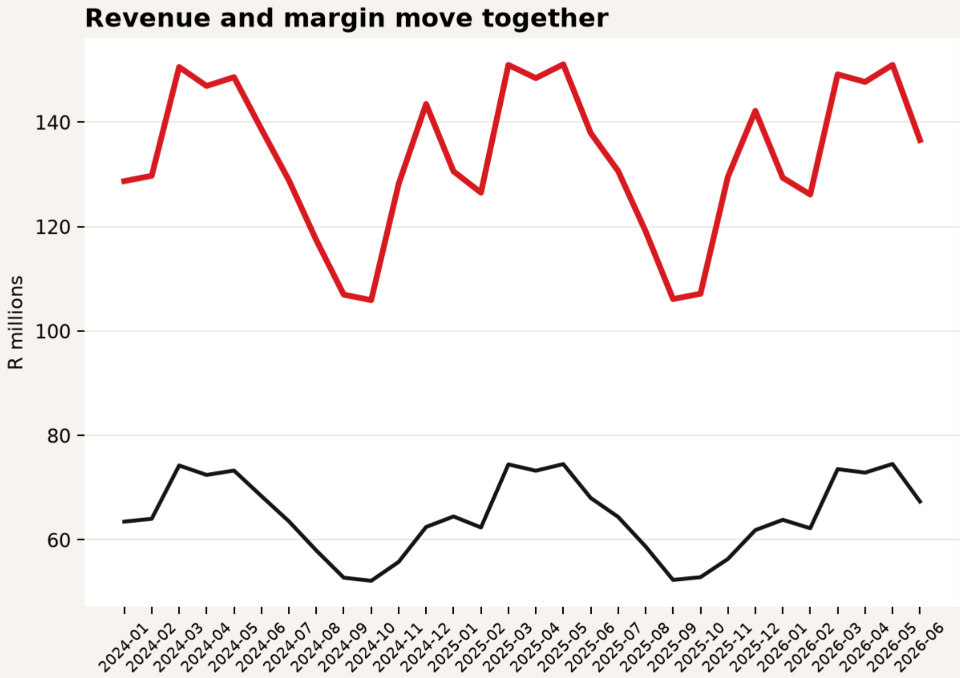
The Money Map: Growth Quality Beats Vanity Revenue

LEATT GROWTH OS

The case study follows margin, returns and category concentration, not only sales.

REVENUE	**GROSS MARGIN**	**RETURN LEAKAGE**	**ORDERS**
R3.99bn	**48.5%**	**4.9%**	**1,449,275**
scale signal	quality signal	risk signal	transaction grain



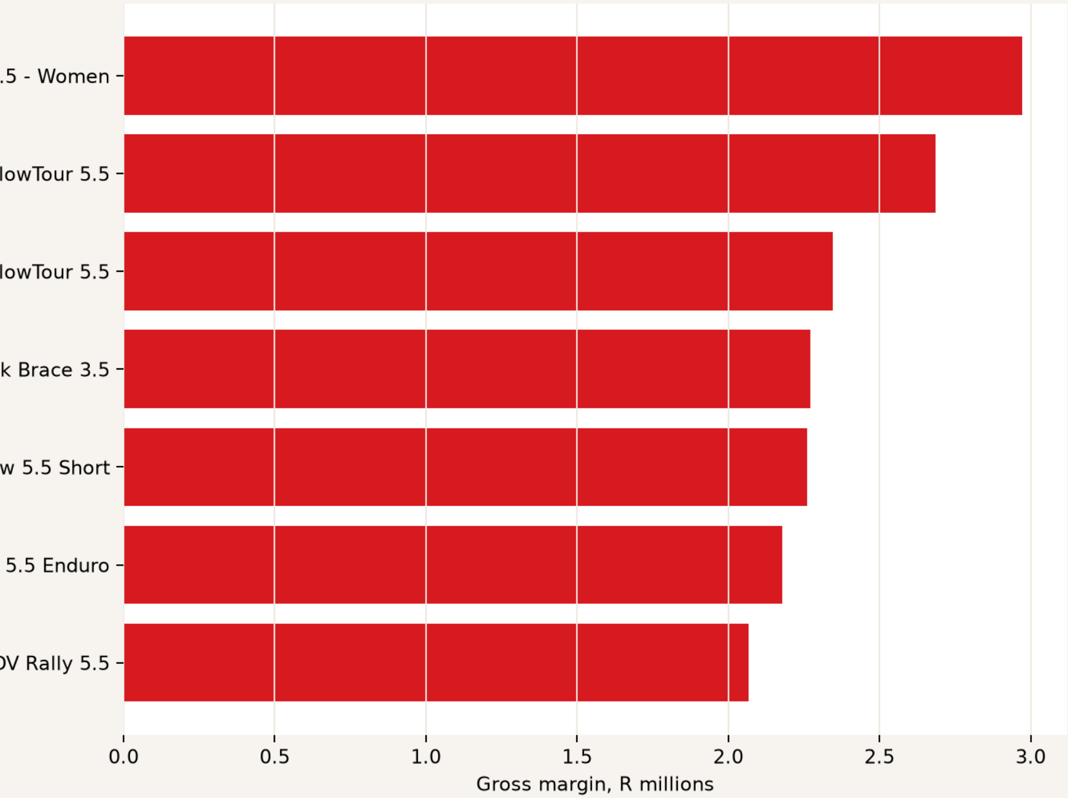


The Leak: Returns Are A Margin Problem Wearing A CX Mask

LEATT GROWTH OS

ML turns return risk from a lagging report into a management queue.

Products to protect by margin



Signal rules

Revenue momentum

Trigger exception commentary in the monthly trading pack.

Margin quality

Protect margin-positive product mix and bundle high-margin items.

Return leakage

Improve sizing, delivery promise, PDP content and post-purchase guidance.

Hero category concentration

Create availability alerts and category-specific SEO/story pages.

Channel efficiency

Move spend toward efficient journeys; keep paid experiments controlled.

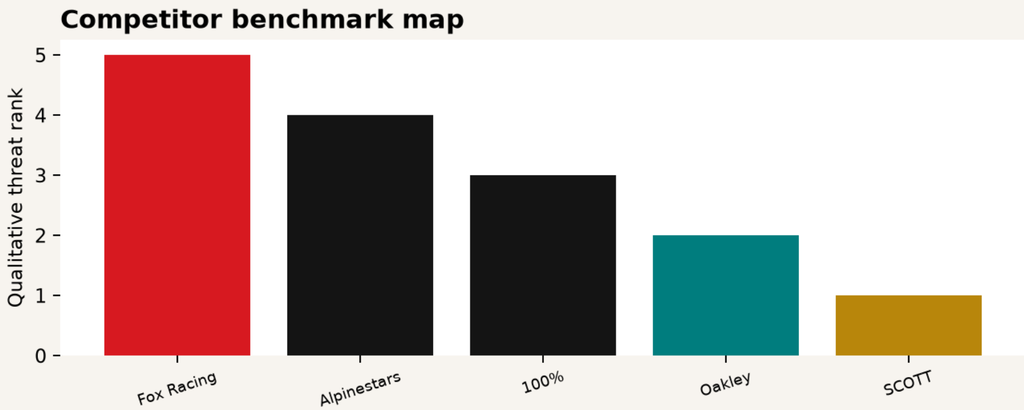
The Growth Loop: SEO, A/B Testing, Campaign Discipline

Growth is only interesting when the loop can be measured and improved.

A/B testing role

Best test: Bundle offer generated R280,051 modeled incremental margin.

Use tests to prove margin-positive change, not cosmetic conversion wins.

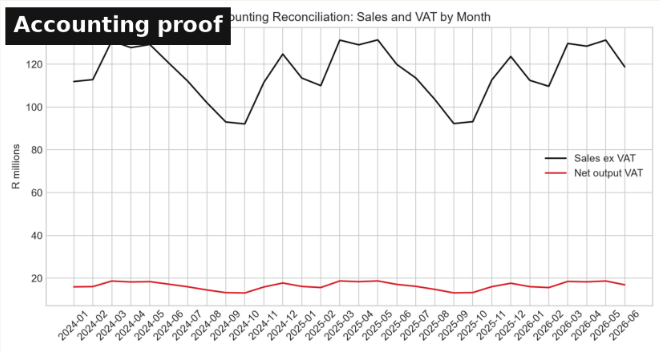


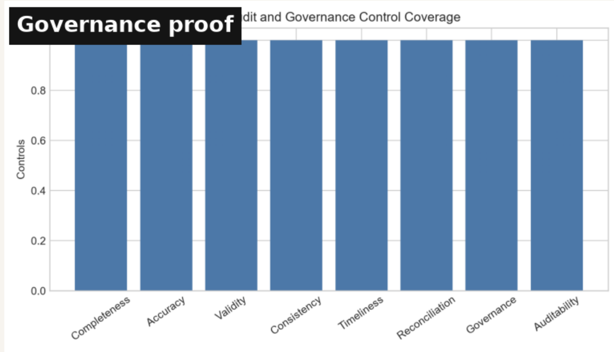
AI SEO roadmap

0-2 weeks	0-2 weeks	2-4 weeks	2-4 weeks	4-6 weeks	4-8 weeks	8-12 weeks
Technical audit	Hero category content sprint	Product feed enrichment	Facet governance	AI visibility dashboard	Profit-based SEO model	Experiment loop

The Control Layer: SAP, Reconciliation, Governance

The report becomes credible when it can survive finance and audit questions.





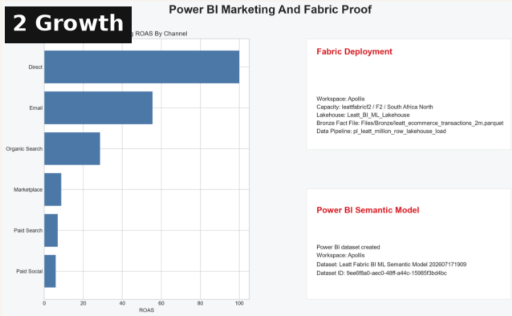
Where SAP fits

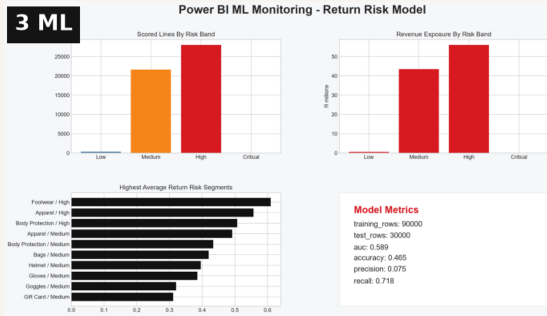
- SAP Business One: practical fit for finance, inventory, VAT, chart of accounts, sales documents and close reconciliation.
- SAP BW: fit when the company already runs SAP enterprise reporting and needs governed extracts into Fabric.
- SAP Commerce / Hybris: possible in a larger SAP commerce estate, but the public storefront evidence does not require it here.
- Fabric remains the analytics layer: ingest, model, score, govern and publish to Power BI.

How To Read The Power BI Report

LEATT GROWTH OS

The report has a path: performance, growth, risk, proof.





S

Start

Are we growing profitably?

T

Then

Which channels/content deserve money?

T

Then

Where is leakage and model risk?

E

End

Can the data be proven in Azure/Fabric/Git?

The Ending: A 90-Day Growth Operating Plan

LEATT GROWTH OS

A case study lands when the viewer knows exactly what to do next.

MOVE	WHY IT MATTERS	OWNER	NEXT ACTION
Return leakage reduction sprint	R19,750,642	COO / CX	Create return-reason taxonomy and product-level return dashboard.
Hero category availability and SEO program	R12,808,359	CEO / Ecommerce	Build category scorecard with stockout, ranking, margin and landing page signals.
Margin-positive bundle testing	R19,384,973	Merchandising / CMO	Run A/B test: product page bundle versus normal recommendation carousel.
Channel budget guardrails	R7,753,989	CMO	Set campaign guardrails: minimum ROAS, conversion lift and margin contribution.
SAP close reconciliation automation	Risk reduction / faster close	CFO / BI Lead	Schedule monthly exception pack with owner, SLA and SAP account mapping.

Interview message: this is not a report pack. It is a senior BI operating model that connects data engineering, Power BI, ML, AI SEO, accounting controls, clou
